SwissProt_42:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                          SUCH AS MELANOWA, HEAD AND NECK SQUAMOUS CELL CARCINOMA, LUNG
CARCINOMA AND BREAST CARCINOMA, BUT NOT IN NORMAL TISSUES EXCEPT
FOR TESTES AND PLACENTA. NEVER EXPRESSED IN KIDNEY TUMORS,
LEUKEMIAS AND LYMPHOWAS.
                                                                                    human and mouse cDNA sequences.";

Proc. Natl. Acad. Sci. U.S.A. 99:116899-16903(2002).

-!- FUNCTION: Not known, though may play a role in embryonal development and tumor transformation or aspects of tumor progression. Antigen recognized on a melanoma by autologous cytolytic T lymphocytes.

-!- TISSUE SPECIFICITY: EXPRESSED IN MANY TUMORS OF SEVERAL TYPES,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,
Mammalia, Eutheria, Primates, Catarrhini, Hominidae, Homo.

"Human gene MAGE-3 code for an antigen recognized on a melanoma by
autologous cytolytic T lymphocytes.";
J. Exp. Med. 179:921-930(1994).
-!- FUNCTION: Not known, though may play a role in embryonal
development and tumor transformation or aspects of tumor
progression. Antigen recognized on a melanoma by autologous
cytolytic T lymphocytes.
-!- TISSUE SPECIFICITY: EXPRESSED IN MANY TUMORS OF SEVERAL TYPES,
SICH AS MELANOMA, HEAD AND NECK SQUAMOUS CELL CARCINOMA, LUNG
CARCINOMA AND BREAST CARCINOMA, BUT NOT IN NORMAL TISSUES EXCEPT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

-! FUNCTION: Involved in the synthesis of the GDP-mannose and
dollchol-phosphate-mannose required for a number of critical
mannosyl transfer reactions.
-! CATALYTIC ACTIVITY: D-mannose 6-phosphate = D-fructose 6-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -!- COFACTOR: Zinc (By similarity).
-!- PATHWAY: Glycosylation; early steps of mannosylation.
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: Belongs to the mannose-6-phosphate isomerase family 1.
                                                                                                                                                                                                                                                                                                                                            InterPro; IPR002190; MAGE.

"Nucleotide sequence of the nifLA operon of Klebsiella oxytoca NG13

"Nucleotide sequence of the nifLA operon of Klebsiella oxytoca NG13

and characterization of the gene products.";

Mol. Gen. 205:253-259(1986).

-!- FUNCTION: NIFPA, A TRANSCRIPTIONAL ACTIVATOR, IS REQUIRED FOR
ACTIVATION OF MOST NIF OPERONS, WHICH ARE DIRECTLY INVOLVED IN

NITRAGEN FIXATION. NIFA INTERACTS WITH SIGMA-54 (BY SIMILARITY).

-!- SIMILARITY: Contains 1 sigma-54 factor interaction ATP-binding
                                                                                                                                                                                                                                                                                                                                                                          Bacteria, Profeobacteria, Gammaproteobacteria, Enterobacteriales,

CATALYTIC ACTIVITY: UDP-glucose + D-fructose = UDP + sucrose.
INDUCTION: By anaerobic stress.
SIMILARITY: Belongs to the glycosyltransferase family 1. Plant

PATHWAY: Tryptophan biosynthesis; second step.
SIMILARITY: Belongs to the anthranilate phosphoribosyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

-!- FUNCTION: Exhibits a very high incrinsic GTPase hydrolysis rate.
INDOJVed in the biosynthesis of the hypermodified nucleoside 5-
methylaminomethyl-2-thiouridine, which is found in the wobble
position of some tRNAs (By similarity).
-!- SIMILARITY: Belongs to the era/trmE family of GTP-binding
proteins. TrmE subfamily.
                                                                                                                                                                                                                                                                                                                                       Mycoplasma pneumoniae.

```

710 AA.

STANDARD;

```
--- FUNCTION: Involved in IL-1 pathway. This kinase associates with the IL-1 receptor IL1-R-1. This association is rapid and IL-1 dependent (By similarity).

---- SUBDUIT: Found in a complex containing TRAFE, PELL1 and IRAK4.

Interacts with PELL3 (By similarity). Interacts with PELL2.

---- TISSUE SPECIFICITY: Highly expressed in liver, followed by kidney.

and skeletal muscle.

-- DEVELDE STAGE: EXPRESSED from Ell day to El8 day.

-- PTM: Autophosphorylated. An extensive phosphorylation of IRAK occurs after its association with ILI-R-1. This step could be linked to the activation of the kinase (By similarity).

-- SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.

PELLE SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  EMBL; U56773; AAC52694.2; -.

chromosome 12q23-q24.";
Oncogene 9:3057-3061(1994).
-!- FUNCTION: Upon binding to EGF receptor enhances EGF-dependent mitogenic signals. Can bind multiple cellular targets.
-!- FUNCTION: Expressed in all tissues analyzed, including heart, brain, placenta, lung, liver, skeletal muscle, kidney and pancreas. Expressed in all epithelial and fibroblastic lines examined and in some, but not all, hematopoietic cells.
-!- PTM: Phosphorylated by several receptor tyrosine kinases.
-!- SIMILARITY: Contains 1 PH domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Proc. Natl. Acad. Sci. U.S.A. 99:4668-4673(2002).
-!- FUNCTION: Reversibly transfers an adenylyl group from ATP to 4'-
phosphopantetheine, yielding dephospho-CoA (dPCoA) and
pyrophosphate (By similarity).
-!- CATALYTIC ACTIVITY: ATP + pantetheine 4'-phosphate = diphosphate +
